## Introduction

Working Families' Tax Credit (WFTC) replaced Family Credit (FC) from 5th October 1999. It is a tax credit available to working families who are responsible for at least one child under 16 (or under 19 if in full-time education up to A-level or equivalent standard). It is payable to two-parent and one-parent families. The applicant or the partner (if they have one) must be working 16 hours or more per week.

The tables cover awards current at 31 May 2000. Awards of both WFTC and FC last for 26 weeks, so only WFTC awards were current at that date. Time series covering both WFTC and FC are also shown, but for dates before November 1997 figures are available only for awards made in Great Britain (excluding Northern Ireland).

The figures in the tables are estimates based on a scan of a random 5% sample of all awards for Great Britain, and of all awards for Northern Ireland. They have been compiled four months after the reference date, by which time almost all awards current at the reference date have been processed and entered onto the computer system. The tables covers awards made in the United Kingdom, unless otherwise stated. As with any sample enquiry, the results are subject to sampling error. For this reason most estimates based on less than 25 cases in Great Britain are shown as '-'. Sampling error is explained in Appendix A.

Problems have been discovered with the classification of recipients between employees and self-employed. The publication of figures using this classification has therefore been suspended.

## Main findings

There were 1,061 thousand WFTC awards current at 31 May 2000, 3 per cent higher than the number of WFTC and FC awards at 29th February 2000.

The average WFTC award was £73.28 per week.

About a quarter of WFTC recipients worked in Personal and Protective Services. This includes Health and Childcare occupations, cleaners, etc. About 6 per cent worked in managerial, administrative or professional occupations.

A total of 2 million children were in families receiving awards. 548 thousand (52 per cent) of the recipient families were headed by lone parents; these families included 903 thousand children - an average of 1.6 per lone parent family. The other 513 thousand families were headed by couples; they included 1,177 thousand children - an average of 2.3 per family headed by couples.

599 thousand (56 per cent) of the recipient families benefited from the 30-hour credit.

111 thousand WFTC awards (10 per cent) included a childcare tax credit, and the average value of this credit for those benefiting was £32.23 per week.

For WFTC awards the average gross weekly earnings of the main earner was £153.

## **Section 9 : Geographical analysis**

This section shows the number of awards in United Kingdom, and their average weekly value, for each Government Office Region.

The number of awards by each local authority and parliamentary constituency are also shown in this section.

All Geographical classifications are derived from the postcode recorded for the applicant, using the 2000 Version 1 Postcode Directory supplied by the Office for National Statistics.

Not all recorded postcodes are complete and accurate. Cases are allocated on the basis of incomplete postcodes if the element present is sufficient to identify the area with certainty.

Particular note should be taken of sampling error (see Appendix A) when making comparisons between geographic areas, or over time.

In this section only, estimates based on fewer than 25 sample cases in Great Britain are shown, but with an asterisk (\*) to indicate that the confidence interval for the estimate is a particularly high percentage of the estimate.

## Appendix A : Sampling error

The data contained in this publication are based on a 5% sample of all GB Working Families' Tax Credit and Family Credit awards. The 5% sample is drawn to represent the characteristics of all awards on the Working Families' Tax Credit system. Therefore, if the number of cases in a sample with characteristic A is 500, we can say that the estimated number of awards with characteristic A on the Working Families' Tax Credit system is equal to 500 multiplied by 20, i.e. 10,000 cases. For the Northern Ireland awards, a 100% scan of awards is made, so there is no need for any grossing regimes.

The sample which has been taken is just one of many different samples which could be taken, therefore the total calculated number of awards with characteristic A is only an estimate of the actual number of awards. If another sample had been taken then the estimate for the same characteristic may have been slightly different.

The table overleaf shows the amount of variation that can be expected from the estimated number of awards with a certain characteristic.

For example, if from a 5% sample there are 500 awards with characteristic A then the estimated number of awards in the population with the same characteristic is 10,000. We could reasonably expect the actual figure to lie between 9,150 and 10,850.

### Formula

Two formulae are used to calculate the standard error and the associated confidence intervals. For samples with less than 30 cases the binomial distribution is used to calculate the standard error. For samples with greater than 30 cases the normal approximation to the binomial is used. The normal approximation formula used to calculate the standard error is:

$\sqrt{(1-F)S} \frac{1}{F}$ , where  $F$  is the sampling factor (e.g. 0.05 for a 5% sample) and  $S$  is the number of sample cases with the characteristic.

In an example where there were 50 sample cases with characteristic A taken from a sample representing 5% of the population, the standard error is:

$$\sqrt{(1-0.05)50} \frac{1}{0.05} = 137.8... \approx 138$$

There is a 95% probability that the actual population value falls within 1.96 standard errors of the grossed up sample value. For the above example this would be:

$$(50/0.05) \pm 1.96 \times 138 = (730, 1270)$$

This range is known as the 95% confidence interval.

Please note that this method can only be applied to estimates of number of awards and not to estimating the sampling error associated with averages such as average weekly award etc.
